Search box implementation in android

LEFT 4 DEAD

Pacchetto ESEMPIO.ABHIANDROID.SearchviewEsempio: import android.content.Context; Importa Android.View.LayOutInflater; import android.view.View; Importa Android.View.ViewGroup; import android.widget.BaseAdapter; import android.widget.TextView; importare java.util.ArrayList; importare java.util.List; importare java.util.Locale; ListViewAdapter di classe pubblica estende BaseAdapter (// Dichiarare variabili Context MContext; Gloccatore di layoutInflater; lista privata animalnameslist = null; ArrayList privato ArrayList; Public ListViewAdapter (Context del contesto, elenco animalnameslist) (Context = context; questo animalnameslist = animalnameslist; gonfiore = layoutInflater; da (mcontext); This.ArrayList = New ArrayList (); this.arraylist.addall (animalnameslist); } Public Class ViewHolder {TestVisualizza nome; } @Override Public Int GetCount () {return animalnameslist.size (); } @Override Public animalnames Getatitem (int Posizione) {return animalnameslist.get (posizione); } @Override Public Long GetItemid (posizione int) {Posizione di ritorno; } Visualizzazione pubblica GetView (POSIZIONE INT FINAL INT, VISUALIZZAZIONE VIEW, Genitore ViewGroup) {Titolare del portavvertenza finale; IF (VIDE == NULL) {Holder = nuovo mirino (); Visualizza = GLUFTER.INFLATE (R.Layout.ListView_ITEM, NULL); // Individua la testista in listview_item.xml titolare.name = (TextView) view.findViewById (r.id.name); view.setTag (titolare); } else {detentore = (mirino) view.getTag (); } // Impostare i risultati in TextViews Holder.Name.setTag (animalnameslist.get (posizione).getanimalname ()); Vista di ritorno; } // filtro vuoto della classe filtrante (String ChartExt) {ChartExt = ChartExt.TolowerCase (Locale.getDefault ()); animalnameslist.clear (); se (ChartExt.Length () == 0) {animalnameslist.addall (arraylist); } else {per (animalnames wp: arraylist) {if (wp.getanimalname (). (Local.getDefault ()). Contains (chartext)) {animalnameslist.add (WP); }} NotifyDataSitchanged (); } } Step 5: added new to a Layout activities. In this method we have set the true or false Boolean value. Below is an example code that obtains the suggestion text that will be displayed in the field of the query of a search view. 4. 6. SearchView Simplesearchview = (SearchView) findViewById (R.id.Simese Archview); // Inzi a paid search view Query = Simplesearchview.getquery (); // Get the query string currently in the text field 2. Searchview Simplesearchview = (SearchView) findViewById (R.id.Simplesearchview); // Inzi a research view Boolean Iconified = Simplesearchview.isiconifiedbydefault (); // Check the predefined iconified state of the research field 4. The True value indicates that icon is possible or expands the search view. Queryhint: is this attribute used to set the optional query suggestion string that will be displayed in the field of empty query. It is possible to set up a color or a background problem of a search view. Background: The background attribute is used to set the background of a search view. Below we take the query string from a search view. Paddingleft: Set the padding on the left side of the search view. Getqueryhint (): à une used to obtain the text of the suggestion that will be displayed in the field of the text of the query. Below we obtain the predefined state of the research field. IMPORTANT NOTE: When a SearchView is used in an action bar as an action view for the folding menu item, it is necessary to set up on iconified by setting Using the SETYNFIEDBYDEFAULT (TRUE) function. This method supports the value of the type of service. SearchView Simplesearchview = (SearchView) findViewById (R.id.Simplesearchview); // Start a pay search search queryhint = simplesearchview.getqueryhint (); // Get the text of the suggestion that will be displayed in the query text field 3. 3. We are creating visual entries that will be displayed within each line. If you want the search field to be visible, then call SeticonifiedDefault (false). Here we extend Baseadapter in ListViewAdapter Class and then set the data in the ListView list using the modal class. 1. Example package.Abhiandroid.searchViewensample; IMPORT Android.os.bundle; Import android.support.v7.app.AppCompatActivity; Import Android.widget.ListView; IMPORT Android.WIDGET.SearchView; Import Java.util.ArrayList; Mainactivity of the public class extends the AppCompatActivity implements SearchView.OnQueryTextListener (// declare the ListView list variables; ListViewAdapter Adapter; SearchView EditSearch; String [] animalnameslist; ArrayList Arraylist = New ArrayList (); @Override Public Void Oncreate (SaviDinstancestate bundle) {super.oncreate (SaviDinstancestate); setcontentview (r.layout.Activity_main); // generate sample data animalnameslist = new string [] {"lion", "tiger", "dog", "cat", "turtle", "mouse", "elephant", "fox", "cow", "Donkey", "monkey"}; // Locate the ListView in listView_Main.xml List = (ListView) findViewById (R.id.listView); for (int i = 0; i < animalnameslist.length; i++) { // create a new ViewHolder object ViewHolder holder = new ViewHolder (); holder.name = animalnameslist [i]; // add the ViewHolder object to the ArrayList arraylist.add (holder); } // Start a search view Simplesearchview = (SearchView) findViewById (R.id.Simplesearchview); // Start a search view simplesearchview.setqueryhint ("See search"); // Set the suggestion text to display in the query text field 6. Padding: The padding attribute is used to set the filling from left, right, up or down. You can set a boolean value for this attribute and the default value is true. The suggestion of the query is the same as the suggestions for Editext. SETICONIFIEDBYDEFAULT (Boolean iconification): This method is used to set the default or resting status of the search field. This method returns the value of the type of service. In Android, SearchView Widget provides the search user interface in which users can enter a search query and then send a request to the search provider. This method returns a Boolean value both true or false. You can also set iconified from XML using the ICONIFIEDBYDEFAULT TRUE OR FALSE property. Below we set the query suggestion of a search view. 3. In this we create a list of animal names and then set the adapter to fill the data in ListView. Below we set the false value for this attribute. In the code below we show the use of SetonQueryTextFocusChangeListener () of SearchView. SearchView Simplesearchview = findViewById (R.id.Simplesearchview); // Start a search view // Execution set on Query Text Listener Event SimpleRichView.Setonquerytextlistener (New SearchView.onquerytextlistener () (@Override Public Onquerytextsubmit (string query) {do something on text send Return False;} @Override Public Boolean Onquerytextcha (String NewText Newtext) // do something when the text changes to return false; }); SearchView attributes: now we talk about some common attributes of a search search that helps us configure it in our layout (XML). Below we set the query suggestion for a search. In this we also implement SearchView.OnQueryTextListener to filter the list of animals based on the search query. ICELLICIFCEDEFAULT: A, this searchview attribute is used to set the default or resting status of the search field.
